

Museum Maker

You are going to design the floor layout for your own museum. You can select as many items as you like.

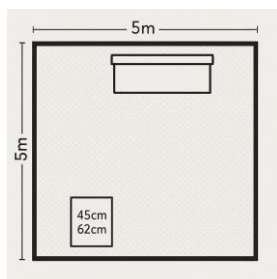

So that you know the size of space you will need for your exhibits, you will need to create a floor plan with measurements listed for the items and exhibition space.

- 1) Select the items that you would like to include in your museum. Note down their dimensions (actual or estimated – height, width and depth)

height = 2.3m
width = 45cm
depth = 62cm

- 2) Now, plan the layout of your museum. Remember this plan will give you a **bird's-eye view** of the items and room layout. You can include the **measurements** alongside each item or select a **scale** to produce your drawing to.

- 3) Think about where any **doorways, corridors or windows** would be located. Add any further design details to your plan.
- 4) If you can, add further details to your plan – including the **perimeter** of the museum space, the **area** that some/all of the items take up, and the **perimeter** of some of the items within your space.
